pom.xml

XML

package.json

46 lines

JSON

For frontend react with MUI and Tailwind, Database postgresSQL and backend springboot and on-prem file storage. Using these dependencies and stacks give one login page code both frontend and backend, include authentication and authorization and also setup swagger. And give a detailed step by step guide to setup all the tools. Also show the preview. And give folder structure.

Orchestrated backend infrastructure initialization strategy

Now the JWT service:

Architected comprehensive full-stack authentication system with storage configuration

JWT service for token generation/validation

Custom UserDetailsService

JWT auth filter

Now I'm setting up the SecurityConfig class to handle authorization rules, CORS configuration, and the password encoder along with the authentication manager.

Spring Security configuration - authentication and authorization rules

Swagger/OpenAPI configuration

Now I'm setting up the file storage configuration for on-premises deployments with basic properties and a storage service stub.

On-prem file storage properties config

Done

Now the AuthController — the core piece:

Created 2 files

Auth controller with login/register endpoints and swagger annotations

Global exception handler for clean API error responses

Done

Now application.yml and the Flyway migration for the user table:

Flagged security concern and commenced frontend development

Application configuration.yml

Flyway migration creating app_user table with a seeded admin

I've flagged that the bcrypt hash placeholder needs to be regenerated with a fresh one. Now moving on to build out the frontend.

Frontend package.json with MUI and Tailwind added

I've swapped out Ant Design for Material-UI based on the user's preference, and now I'm mapping out the full project structure—tailwind and postcss configs, vite setup, the HTML entry point, main TypeScript file, theme configuration, global styles, the main App component, API client, authentication context, route protection, login page, and type definitions.

Tailwind config

PostCSS config

Vite config

index.html

Tailwind entry CSS

MUI theme

Auth types

Axios client with auth interceptor

Auth API calls

Auth context for global auth state

Protected route wrapper handling authorization by role

Done

Now the Login page — the centerpiece, combining MUI components with Tailwind layout

Now the login page — the centerpiece, combining MUI components with Tailwind layout classes, react-hook-form + zod:

Created 3 files

Now let me zip both projects and prepare the visual preview.

Architected comprehensive full-stack authentication solution with preview mockup

Now let's build the live preview of the login page.
